

Tips for Measuring Tanks!

1. Measure each tank about the same time each operating day.
2. Use gauge sticks that are:
 - marked to the 1/2 centimeter
 - not worn or broken at the bottom
 - varnished and not warped
3. Use good stick practices:
 - slowly lower stick
 - gently touch stick on tank bottom
 - quickly pull stick out
 - read to the nearest ½ centimeter
4. Measure before and after each delivery. Remember to wait at least
five minutes after delivery to measure again.
5. Check for water daily using water-finding paste that is compatible with ethanol fuels.
